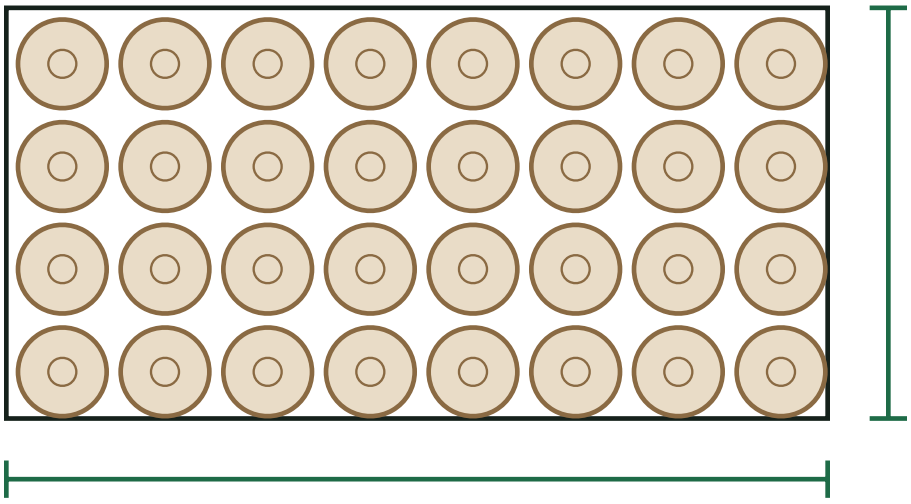
How to measure firewood

Permits are sold by the cord. A cord is a tightly stacked pile 8 feet long, 4 feet high and 4 feet deep: 128 cubic feet of wood and air.



The green lines show the 8-foot length and the 4-foot height. Logs are 4 feet long, so the stack is 4 feet deep.

Rules of thumb

- A full-size pickup bed, loaded level with the rails, holds about half a cord.
- A compact pickup bed holds about a third of a cord.
- Stack tightly, bark side up, before you measure. A loose pile looks larger than it is.
- Each haul tag covers half a cord. Use a new tag for every half cord you load.
